SIGNALLING CHANGES

Take control of 21CN with DigiPlus[®]

DigiSolo[®] and DigiPlus[®]

Guarantee your digital communicators are Next Generation Network (NGN) and 21CN Compatible by adding a small hardware module that compliments your existing digital communicator.

NGN and 21CN Compatible

DigiSolo[®] and DigiPlus[®] are essentially the same product – the new version of DigiSolo[®] is able to convert and upgrade to a DigiPlus[®] either from the point of purchase or at any point in the future. Every DigiSolo[®] is connected to DualCom's Gemini managed network free of charge but is not enabled with the features of DigiPlus[®] until activated. The DigiSolo[®]/DigiPlus[®] single hardware platform was developed in conjunction with

Vodafone to fit between any existing digital communicator and the telephone line providing an improved and robust signalling solution. It is guaranteed to make all existing digital communicators fully compatible with NGNs and BT's new 21st Century Network (21CN) as it uses a 300 baud modem. The sole purpose of DigiSolo[®] is to provide immunity for NGN/21CN round-trip issues. In addition DigiPlus[®] guarantees compatibility and provides a fixed cost solution to varying non-geographical telephone number rates used by most UK Alarm Receiving Centres by using 0800 free telephone calls for all alarm and polling traffic. DigiSolo[®] can be upgraded to a DigiPlus[®] remotely by your ARC for an additional monthly payment – this payment can be offset by your Customers' saving on telephone charges.

DIGIPLUS[®]

DualCom[®]

SIGNALLING CHANGES

SPECIFICATION:

- Guaranteed to make all digital communicators NGN and 21CN compatible
- Simple to fit in less than 5 minutes and supplied ready programmed
- No need to change/reprogram/adjust existing digital communicator
- More robust administration structure for older digital communicators
- Can use any telephone line from any provider
- Will not affect or be affected by other telephone equipment

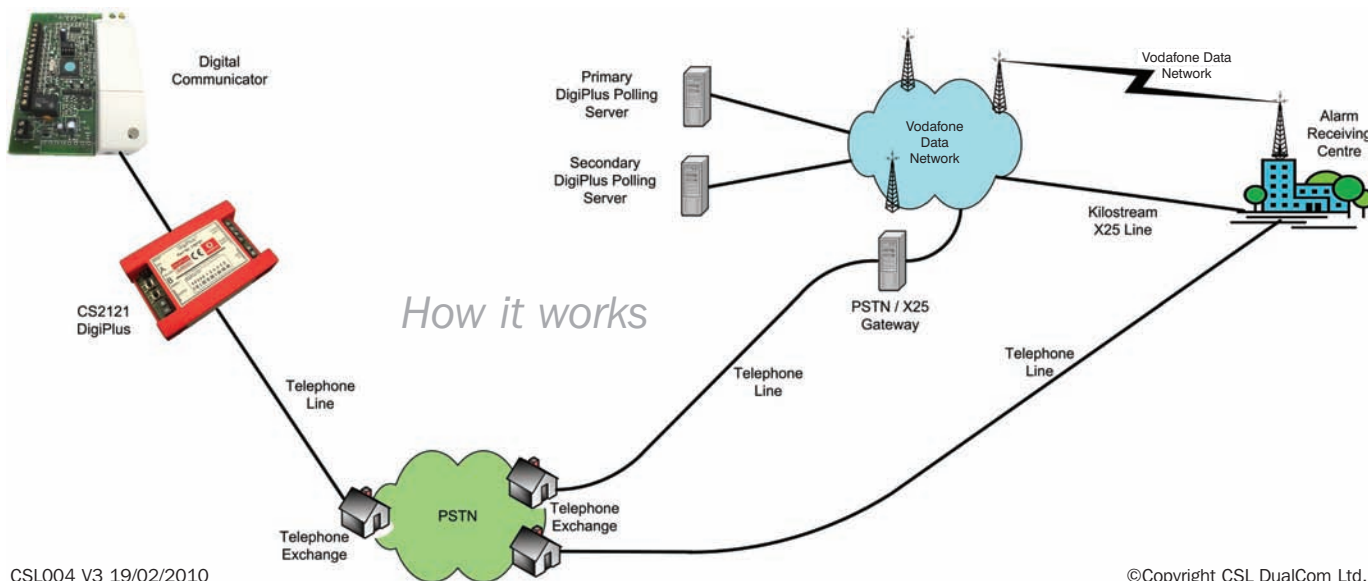

DigiPlus[®] offers the following additional benefits:

- 0870/71/44/45 call charging proof with free 0800 alarm and polling calls
- End user costs reduced as telephone call costs disappear
- Secure Signalling through the DualCom Gemini Managed Network
- Flexibility to volume transfer connections remotely
- Can be remotely reconfigured

Solution

DigiSolo[®] and DigiPlus[®] provide an invaluable solution to the issues created by the current upgrade of the UK's telephone network from analogue switched circuit (PSTN) technology to digital Internet Protocol (IP) technology. The new Networks are known as Next Generation Networks the biggest of these being BT's 21st Century Network. In total BT plan to have upgraded 40% of its Network by 2012 – that's 10 million premises! NGNs could affect many intruder and fire alarm systems signalling to Alarm Receiving Centres (ARCs). Many tens of thousands of older intruder alarm systems that use Digital Communicators (DigComs) will be more seriously affected. During migration DigComs will experience outages of up to 30mins, during which time no alarms will be delivered to your ARC. This may leave end users with large telephone bills and burden installers with outdated legacy equipment.
